Universal Application Integration

Can You Integrate Any Two Applications In A Day?

### Is Your Organizations IT Designed with a Unified View of Its Applications and Data?

Just few enterprises have been able to fully integrate the core systems that their businesses rely on. The wide variety of application environments, ranging from the mainframe, to the desktop, to the Web makes the task virtually impossible, and developers have bridged the gaps between applications by writing integration code. However, most integration solutions that either require custom coding or EAI middleware approaches are too costly, complex and time consuming. In addition, lack of access to the specifications or source code makes any integration project literally impossible.

Ephphatha – A Cutting Edge Approach to Solving System and Application Interoperability

By capitalizing on the ubiquity of the Graphical User Interface, the Ephphatha Studio leverages application windows as a basis for a universal approach to software integration. For the first time in the history of computing, an organization can reap the benefits of knowing that only one integration methodology will solve almost all of their interoperability challenges. Ephphatha Studio offers a new, non-invasive way to release the value trapped in applications, databases and business systems. It provides developers with one simple object model to access applications that run on a Windows platform in order to: create programmatic access to proprietary applications WITHOUT requiring source code access; extend applications to new platforms; and reuse functionality and data from existing applications.

A Non-Intrusive Solution : MAT' s Ephphatha Studio non-invasively exposes windows - viewable applications at run time, in real time, turning them into programmable objects. Without requiring access to source code, it lays bare an application's data and functionality, and enables developers and solution providers to deliver time efficient, cost-effective integration solutions through development and deployment systems.

"If you can see the data, you can grab the data from one application and get them to work in the other applications."

Intuitively Obvious Solution: Even if a packaged application such as SAP offers a set of API, developers have to understand lots of functions that allow them to manipulate the data and functionality of each application and retool for their integration for every specific application. With Ephphatha Studio, developers no longer have to understand the specific implementation of an application. It gives developers a toolkit that lets them work with any application they' re likely to find in the client environment. It works for any application, whether it' s a Win32 app or an AS/400 viewer or a browser, and provides a universal API to developers.

Ephphatha Studio - A Software Solution With Unique Added Value

Ephphatha Studio provides a non-disruptive, non-invasive application agnostic methodology. To find out more about Ephphatha Studio, please contact
